

SOUTH 56TH STREET RELIABILITY PROJECT

Welcome!

The South 56th Street Reliability Project is a multi-step project to rebuild transmission lines and structures along 56th Street, from Everett Street to Elkcrest Drive. The project will begin in mid-2023, with the relocation of overhead distribution lines to underground. Burying these lines will improve neighborhood aesthetics, reduce impact from vehicle/pole accidents and build upon our reliability now and in the future.

Once distribution lines are relocated, LES will replace the large transmission structures and lines overhead. This portion of the project will update structures to support increased electricity needs for the area and increase the span of the lines between structures. The project is expected to be complete by December 2025.

A map of the project area is located on the back.

The purpose of this project is to...

- Remove overhead distribution power lines and install facilities to underground and at-grade equipment.
- Replace aging transmission infrastructure and increase span between transmission structures.
- Maintain system reliability.
